

IMC Prosperity 4

Backtesting under uncertainty · Team Tomato Cartel

An international trading competition project focused on turning noisy signals into disciplined, cost-aware decisions. My individual role was Backtester; the final ranking belongs to the team.

TEAM FINISH

#750

COMPETING TEAMS

OVERALL BAND

Top 4%

What I did

- Built and ran AI-assisted Python backtests over historical CSV data.
- Compared strategy parameters and incorporated spreads and transaction costs.
- In the final round, helped narrow a 10-category strategy to four categories where the signal remained viable after costs.

What this demonstrates

- Experimental design and evidence-based iteration.
- Knowing when not to act after costs invalidate a signal.
- Translating analysis into a team decision under deadline.
- Clear separation between individual contribution and team outcome.

SIGNALS → RULES → DECISIONS

The core story is disciplined evaluation—not a claim of professional trading.

Final team leaderboard

The official leaderboard identifies Tomato Cartel at overall position #750. It also shows algorithmic #951, manual #749, and country #9.

SAFE PUBLIC WORDING

"The team qualified for the finals and finished 750th of 18,803 teams (top 4%)."
